Education in the field of entomology has long history since inception of scientific training and research in Indian Subcontinent. Conceived as agricultural zoology and culminating as Agricultural Entomology, study of insects has not changed as it should be in terms of educational challenges. Though strategies for collaboration with other scientific disciplines have been formulated or added at many occasions but it is felt that education in entomology has not moved forward. Bottleneck in this case is lack of awareness of curricular development on modern scientific basis. These curricula were not measured on the basis of science literacy, thus the education in entomology must undergo significant transformation to take advantage of the expanding world of knowledge and information. Without any doubt, insects are ideal creature for signifying many life sciences principles; since insects are easy to handle and hypnotize public attention. The main objective of seminar “Recent trends in Entomological Education” is to extrapolate the dimensions of curricular fabrication for the teachers and scientists to meet dynamic orientation of educating and training in the field of Entomology.
